TummyOnTrack Database

TODO: Need to research how referencing to directly reference to another table's object works in Firebase

User Table: Store User info

User Table	
objectId	String
username	String
password	String
email	String
createdAt	Date
updatedAt	Date

Profile Table: Store child profiles for each user

Profile Table	
objectId	String
user	Reference to a User object
name	String
age	Number
profilePhoto	File
isParent	Bool
unusedPoints	Number
usedPoints	Number
GoalPoints	Number
rewards	Array of References of objects from Reward table
createdAt	Date
updatedAt	Date

TagsCollection table: Store all the keywords and different tags
tagName: can be "FoodClassification", "FoodType", "Nutrients"

tagName "FoodClassification" possible tagValues - "Fruit", "Vegetable", "Meat", "Poultry", "SeaFood", "Dessert"
categoryName "FoodType" values - "Meal", "Snack", "Dessert", "Side Dish", "Junk", "Salad"
categoryName "NutrientsSource" values - "Protein", "Vitamins", "Calcium", "Carbohydrates", "Sugar"

TagsCollection Table	
objectId	String
tagName	String
tagValue	String
createdAt	String
upatedAt	String

FoodCollection Table

List of all the food items. Every food item will be tagged as per examples below. This will help us to search as well as created chart analysis based on various components.
